                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New inositolphosphoryl ceramide synthase genes from fungi - useful for identifying compounds for anti-fungal therapy Claim 5: Page 44-45: 53pp. English.

The present sequence encodes a pure inositolphosphoryl ceramide (IPC) synthase protein from a fungal cell, candida neoformans. The present invention also describes a method for identifying inhibitory compounds of fungal IPC synthase protein activity. IPC synthase proteins are useful for identifying inhibitors of fungal sphingoliphol blosynthesis, as the IPC synthase catalyses a step in the synthesis of inositolphosphoryl ceramide from ceramide and phosphatidylinositol. Fragments of IPC synthase proteins are also useful as probes or primers for identification and isolation of homeous genes.

Sequence 3220 BP; 706 A; 910 C; 819 G; 785 T;
as the IPC synthase catalyses a step in the synthesis of inositolphosphoryl ceramide from ceramide and phosphatidylinositol. Fragments of IPC synthase proteins are also useful as probes or primers for identification and isolation of homologous genes. Sequence 3168 BP; 692 A; 899 C; 765 T;

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of this sequence represents one of 5191 Staphylococcus aureus DNA sequences of this sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable commonly read-only memory (ROM) or CD-ROM. Homology searches using the Saureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can composition against Saureus infection. The polypeptides can also be used in a kit for the immunodetection of sample. Saureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences contained on the contained contained on the contained cont

The encoding human amine receptor - used to identify agonists and antagonists, or amine neurotransmitters

Claim 1: Fig 1A-1C; 68pp; English.

Claim 1: Fig 1A-1C; 68pp; English.

C ADNA clone (151051) codes for a human 7-transmembrane receptor of w09110) putatively identified as an amine receptor on the basis of sequence homology to the rat amine receptor. It was disovered in a human genomic library and can be found in human monocytes.

C is a produced the CDNA allows recombinant produ. of human amine receptor in transformed host (e.g. E. coll, COS, insect) host calls. Polynuclectides can be used as probes to detect mutations in the amine receptor gene, and in the gene therapy of conditions associated with under-expression of the receptor.

Claim 1: Page 2058-2059; 2245pp; Japanese.
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 783 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared if com various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-end of mRNA by using poly(7) as the sole primer. Since the 3'-end of mRNA by using poly(7) as the sole primer species, almost in translated sequence is unique to a particular mRNA species, almost is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be cetermined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Tissue isolation and library construction performed at the National
Institute of Diabetes and Digestive and Kidney Diseases, NIH (see
http://www.niddk.nih.gov/intram/people/boliver.htm). DNA sequencing
and analyses performed by National Institutes of Health Intramural
Sequencing Center (NISC; see http://www.nisc.nih.gov). Chromatogram
data were analyzed and evaluated for high quality using the ted
program (Gleeson T and Hillier L, 1991).

W33782 standard; peptide; 6 AA.
W33782;
19-JUN-1998 (first entry)
Peptide #3 used in immunomodulating dimer peptide.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain; rejection.
Synthetic.
Flomo sapiens.
W09744351-A1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 14: Page 34: 80pp; English.

R83061-R83085, R83096-R83096 and R92907-B92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            16-MAY 1996 (first entry)

(STRD ) UNIV LELAND STANFORD JUNIOR - USEful for inhibiting transplant rejection
(Claim 10; Page 36; 41pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimume diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Training alpha-1 domain, used for preventing rejection of transplants or treating autochmune diseases.

Example 1: Page 19: Alpp: English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating activity, including the N-terminal acylated and/or creminal anidated or estrified forms of up to 60 amino acids, where the peptide-type compound comprises the formula: A-B, where A, B = C creminal anidated or estrified forms of up to 60 amino acids, where the peptide-type compound comprises the formula: A-B, where A, B = C creminal anidated or estrified forms of up to 60 amino acids, where the peptide-type compound comprises the formula: A-B, where A, B = C creminal anidate or estrified forms of usa81 and a represents amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid; acid: The sequences in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions of T or any peptide type bond within the brackets. They can also be used to inhibit the profiteration of T cells in cresponse to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, chematoid arthritis and lupus erythematosis. The products can also be conserved.

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                      The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           19-JUN-1998 (first entry)

Peptide B-7702.75-84b31 tested for immunomodulating activity.

Immunomodulating dinme: immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 29; DB 1; Length 10; 100.0%; Pred. W82804 to W82829 are cytomodulating lipophilic oligopeptides. The algometrian oligopeptides are used to inhibit: (1) activity of lymphocytes
cligopeptides are used to inhibit: (1) activity of lymphocytes.

Competidated are pageorytes); (11) production of inflammatory cytokines, and monounclear phagocytes); (11) production of inflammatory cytokines, and (11) an inflammatory response in mammals (e.g. in cases of septic shock, remumatoid arthritis (RA). Crohm's disease, collitis and allergy). They are also used for modulating activity of haem-containing enzymes and for dispapentes mellitus, RA and systemic lupus erythematosus). In all cases the oligopeptides may be generated from nucleic acids, and treatments are in vitro or in vivo. A specific application is treatment of organs or cells for transplantation, or of the recipient of such transplants.

Apart from therapeutic use, the oligopeptides can be used to study mechanisms of T cell (de)activation and to raise antibodies (used to identify oligopeptides and to raise anti-idiotypic antibodies (used to identify oligopeptides and to raise anti-idiotypic antibodies (used to oligopeptides of the oligopeptides. The oligopeptides are administered by bolus injection or infusion, typically at 0.1-50 (preferably 1.25) mg/Kg.

The Actinomadura hibisca polyketide synthase proteins W54380-W84390 form
The Actinomadura hibisca polyketide synthase proteins W54380-W84390 form
a multienzyme complex. The enzyme is used for the biosynthesis of a
dihydrobenzo(a)naphthacenequinone aglycon preferably a pradimicin which
is an antibiotic useful against systemic fungal infections caused by
Candida albicans, Aspergillus fumigatus and Cryptococcus neoformans. It
is also active against a wide variety of fungi and yeasts, some
Gram-positive bacteria and viruses.
                                                                                                                                                                                                                    Gaps

Example 1; Fig 2A; 39pp., French.

The present sequence is that of the variable region of the kappa light chain from murine monoclonal antibody X20. The antibody recognises the beta I subunit (CD29) of integrins and inhibits activation and proliferation of peripheral T cells induced by anti-CD3 antibodies. Monoclonal antibody K20 is a preferred target for humanisation; the humanised version may be useful as an immunosuppressant. In the humanisation process, the complementarity determining regions (CDRS) of a human antibody with framework regions 70-95% homologous to those of K20 were replaced by the K20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; pp; English.

This is encoded by the human pre-B gene which differs from the mouse pre-B-2 gene (of N82441) at several posns. The gene is also selectively expressed in pre-B cell lines. Its pattern of express- lion follows that of Vpre-B1 and lambda-5 in the mouse.

MEF2 transcription factors can be used to produce transgenic animals with increased muscle mass, to prevent or counteract muscle atrophy in humans or animals suffering a pathological muscular condition, or codevelop pharmacological agents which regulate the expression of muscle-tissue genes. MEF2 isoforms are given in Q58740-44, R50038-45 and R57772. Nucleic acid encoding a member of the MEF2 protein family pref, comprises a sequence encoding at least eleven sequence SEEELEL (R57773).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transplant rejection
Claim 10; Page 36; 41pp; English.
The present sequence is an immunomodulatory peptide, which
The present sequence is an immunomodulatory peptide, which
comprises a Class I HiAP-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
the treatment of autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nuclectide sequence selectively expressed in pre-B cells - used in probes for determining non-T acute lymphoblast leukaemla and for prepn. of polypeptide(s)
Disclosure; pp. English.
This is encoded by the genomic form of the variable region pre-B-2 sequence. The gene is not rearranged during pre-B cell development. This protein may associate with itself or with heavy chain v domains expressed in pre-B cells. The gene is expressed only in pre-B cells ines. See also N80470-75, N80476-77 and N82442.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                        Nucleotide sequence selectively expressed in pre-B cells - used in probes for determining non-T acute lymphoblast leukaemia and for propen. of polypeptide(s) Disclosure; pp; English.

This is encoded by the genomic form of the variable region pre-B-1 sequence. The gene is not rearranged during pre-B cell development and is 4.6 kb upstream of the lambda-5 gene. This protein can associate with itself or with heavy chain V domains expressed in pre-B cells. Vpre-B-1 and lambda-5 form a complete V domain via non-covalent bonds. The gene is expressed only in pre-B cell lines. See also N89470-74, N80476-77 and N82441-42.

Triangle of the sequence represents a specifically claimed peptide which forms part of the immunomodulating dimer peptides of the invention. A peptide-type of the immunomodulating dimer peptides of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity.

Including the N-terminal acylated and/or C-terminal amidated or capture of forms of up to 60 main. A part of the anion of the compound comprises the formula; A-B, where A, B - R mad6-77L) (aa79-84) or campaises the formula; A-B, where A, B - R mad6-77L) (aa79-84) or campaises the formula; aa76 = B or V; aa77 = D, S or N; aa79 = R or G; aa80 - I or N; aa81, aa84 = B hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequences related to a class I HIA-B alphal domain (positions 79-84). They can be used to inhibit cytocoxic T-lymphocytes (CTL) from undesirably attacking cells in a class or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transpanse or for treating autoimmune and a surphematorial and an arth-Hitle and lumis autoimmune and an arth-Hitle and lumis carribeant or the proliferation of transpanse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis. Sequence 6 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    19-JUN-1998 (first entry)
Peptide #1 used in immunomodulating dimer peptide.
Immunomodulating dimer: fimunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New immunomodulating dimer peptide(s) - based on a Class I HLA-B
alpha-1 domain, used for preventing rejection of transplants or
treating autoimmune diseases

Tosoophila laminin A chain sequence, interspecies comparison, and domain structure of a major carboxyl portion.";

J. Biol. Chem. 266:22899-22904(1991).

T. FUNCTION: BINIDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

CHICATON: DIVERSE FUNCTION NUTATIONS LEAD TO LATE EMBRYONIC CETHALITY. CERTALIN PARTIAL LOSS-OF-FUNCTION MUTATIONS GIVE RAISE TO ESCAPER ADULTS, WHICH HAVE ROUGH EYES ASSOCIATED WITH CHANGES IN CHANGES IN CELL FATE AND PATTERN, MISSHAPPEN LEGS AND DEFECTS IN WING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   - 1- SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYPETIDE CHAINS (ALPHA, BETA, GAMAA), WILCH ARE BOUND TO EACH OTHER BY DISGLIFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.
- SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).
- ISSUE SPECIFICITY: URBAL FORMED MESODERM AND LATER PROMINENTLY EXPRESSED IN HEMOCYTES, WHICH ALSO SYNTHESIZE COLLAGEN IV.
- EXPRESSED IN HEMOCYTES, WHICH ALSO SYNTHESIZE COLLAGEN IV.
- DEVELOPMENTAL STAGE: DORING MORPHOGENESIS, MOSTLY IN EMBRYO DEVELOPMENTAL 10-12 HOUNG.
- DOWAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.
- DOMAIN: DOMAINS I LAMININ WITH THE DOMAIN VI).
- SIMILARITY: CONTAINS 1 LAMININ DOMAIN IV (DOMAIN IV' IS NOT SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. FUNCTION: THE 26S PROTESE IS INVOLVED IN THE REGULATORY
DESCRAPATION OF UBIOUITINATED PROTEINS. THE REGULATORY (OR ATPASE)
COMPLEX CONFERS ANT DEPENDENCY AND SUBSTRATE SPECIFICITY TO THE
26S COMPLEX (BY SIMILARITY).
-: SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.
                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
